

Thermodynamics II

Fugacity Calculation: Examples

Dr.-Eng. Zayed Al-Hamamre

Chemical Engineering Department | University of Jordan | Amman 11942, Jordan
Tel. +962 6 535 5000 | 22888

Example

Determine the fugacity (MPa) for acetylene at: (a) 250K and 10 bar; (b) 250K and 20 bar. Use the virial equation and the shortcut vapor pressure equation.

for acetylene: $T_c = 308.3$ K, $P_c = 6.139$, $\omega = 0.187$, $Z_c = 0.271$.

At 250 K, $P^{sat} = 1.387$ MPa.

Example

Determine the fugacity, in bars, for R134a for a Redlich-Kwong gas at 90 °C and 10 bar. Compare against Van der Waals EOS.

$$p = \frac{RT}{v-b} - \frac{a}{\sqrt{T} v (v+b)}, \quad a = 0.42748 \frac{R^2 T_c^{2.5}}{P_c}, \quad b = 0.08664 \frac{RT_c}{P_c}$$

In R134, ($C_2F_4H_2$), we have $T_c = 374.3 \text{ K}$, $P_c = 40.6 \text{ bar}$, $M = 102.3 \text{ kg / kmol}$.

Tel. +962 6 535 5000 | 22888

Example cont.

$$RT \ln \frac{f}{f_0} = Pv - P_0v_0 - \int_{v_0}^v P dv$$

$$\ln f = \frac{b}{v-b} + \ln \frac{RT}{v-b} - \frac{a}{RT^{3/2}} \left[\frac{1}{v+b} + \frac{1}{b} \ln \frac{(v+b)}{v} \right]$$

$$\ln \phi = \int_0^P \left(\frac{\bar{V}}{RT} - \frac{1}{P} \right) \partial P$$

$$\ln \phi = \ln \left(\frac{\bar{V}}{\bar{V}-b} \right) + \frac{b}{\bar{V}-b} - \frac{2a}{RT^{3/2}b} \ln \left(\frac{\bar{V}+b}{\bar{V}} \right) + \frac{a}{RT^{3/2}b} \left(\ln \left(\frac{\bar{V}+b}{\bar{V}} \right) - \frac{b}{\bar{V}+b} \right) - \ln \frac{P\bar{V}}{RT}$$

Chemical Engineering Department | University of Jordan | Amman 11942, Jordan
Tel. +962 6 535 5000 | 22888

Example cont.

; the specific volume directly from the EOS ($v = 2.724 \text{ m}^3 / \text{kg}$);

$$\longrightarrow f = 9.09 \text{ bar}$$

for a Van der Waals gas

$$P = \frac{RT}{(\bar{V}-b)} - \frac{a}{\bar{V}^2} \quad \text{Where} \quad a = \frac{27R^2T_c^2}{64P_c} \quad b = \frac{RT_c}{8P_c}$$

$$\ln f = \frac{b}{v-b} + \ln \frac{RT}{v-b} - \frac{2a}{RTv}$$

$$\ln \phi = \ln \left(\frac{\bar{V}}{\bar{V}-b} \right) + \frac{b}{\bar{V}-b} - \frac{2a}{\bar{V}RT} - \ln \frac{P\bar{V}}{RT}$$

$$f = 9.21 \text{ bar} .$$

HW

Calculate the fugacity and fugacity coefficient for water for the temperature range 300 to 1000 °C and pressure 1000 to 10000 bar using

1. Steam table data
2. Van der Waals equation
3. Redlich-Kwong equation

Show that

$$\begin{aligned} RT \ln \frac{f_i}{y_i P} &= RT \ln \hat{\phi}_i \\ &= \int_{v=\infty}^v \left[- \left(\frac{\partial P}{\partial n_i} \right) + \frac{RT}{n_T v} \right] \cdot \partial(n_T v) - RT \ln z \end{aligned}$$

Chemical Engineering Department | University of Jordan | Amman 11942, Jordan
Tel. +962 6 535 5000 | 22888

Show that

$$\begin{aligned}\ln \frac{f}{P} &= \frac{-1}{RT} \int_{P=0}^P \left(\frac{RT}{P} - v \right) dP \\ &= z - 1 - \ln z - \frac{1}{RT} \int_{v=\infty}^v \left(P - \frac{RT}{v} \right) dv\end{aligned}$$

1. Volume-explicit EOSs, like the little EOS, are useful for vapors whose behavior is close to ideal gas behavior. They are not useful for gases far from the ideal gas state.
2. Pressure-explicit EOSs can represent both liquid and vapor and behavior near the critical state with fair accuracy for simple EOSs (like cubic EOSs) and very good accuracy for more complex EOSs, like the BWR EOS.
3. With suitable mixing rules, these pressure-explicit EOSs can make good-to-excellent estimates of high-pressure VLE. They are very widely used for that purpose.
4. This appendix has more mathematics than seems appropriate in the main text.
