

# General Principles of Amputation Surgery

**Freih Odeh Abu Hassan,**  
**F.R.C.S(Eng),F.R.C.S(Tr.& Orth.)**  
**Professor of Orthopedics**  
**University Hospital-Amman**

# Amputation

**A procedure that removes a part of a limb through one or more bones .**

# Disarticulation

**A procedure that removes a part through a joint.**

**The term amputation is applied to both procedures**

# Amputation

**Is the most ancient of all  
surgical procedures**

# History of Amputations

<u>Treatment</u>	<u>Punishment</u>	<u>Cosmetic</u>
<b>Wounds</b>	<i>Stealing</i>	<i>Sacrifice</i>
<b>Fractures</b>	<i>Laziness</i>	<i>Mimic amputee gods</i>
<b>Deformity</b>	<i>Rebellion</i>	
<b>Infection</b>		
<b>Gangrene</b>		
<b>Ergotism</b>		
<b>Pain</b>		

# World War I Amputation

1/19/2011

Professor Freih Abuhassan -  
University of Jordan

6

# Early Surgical amputation

**1- The limb was rapidly severed from an un-anesthetized patient.**

**2-The open stump was crushed or was dipped in boiling oil, for hemostasis .**

1/19/2011

Professor Freih Abuhassan -  
University of Jordan

8

*Sundry forms of actual Causteries fit in all necessary cases of all parts.*

1/19/2011

Professor Freih Abuhassan -  
University of Jordan

10

# Early in the Sixteenth century

Amputation surgery  
and prosthetics were  
much improved by

**Ambroise Paré,**  
a French military surgeon.

# Ambroise Paré

- 1- Created more functional stumps.**
- 2- The first to use ligatures to control bleeding after amputation**
- 3-He designed relatively sophisticated prostheses.**

# Seventeenth century

Amputation surgery was further improved by Morel's introduction of the *Tourniquet*

1/19/2011

Professor Freih Abuhassan -  
University of Jordan

16

**With the development of anesthesia  
and aseptic technique**

**Surgeons for the first time**

**1-Could carefully fashion sturdy and  
functional amputation stumps**

**2-Could reasonably anticipate healing  
of the wound without infection**

# War Anesthesia

- **Chloroform**
- **Ether**
- **Opium**
- **Whiskey**
- **Quinine**

# War Surgical Tools.

# *INCIDENCE OF AMPUTATION*

## **USA**

**Prevalences from 350,000 to  
over 1 million amputees .**

**20,000 - 30,000 new  
amputees each year.**

- 
- \* **85-90 % in L.L**
  - **50% are below knee**
  - **40% above knee**
  - **10% are hip Disarticulations**
  - \* **R=L**
  - \* **75% in men**

# Amputee Incidence

- Approximately 310,000 in USA
  - 2/3 are missing a lower limb (1996)
  - 7% are below 21 years of age
    - > % missing upper limb
    - Twice as often due to congenital

# INDICATIONS FOR AMPUTATION

**Irreparable loss of the blood supply of a diseased or injured limb is the only absolute indication for amputation regardless of all other circumstances.**

# GOALS

- 1-Ablation of diseased tissue**
- 2-Reconstruction:**
- 3-Optimize pt function and reduce morbidity to produce a physiological end organ.**
- 4 -Reduce mortality**

# General indications for amputation

**1-P V. DISEASE → 78%**

**2-INJURY → 20%**

**3-INFECTIOIN**

**4-TUMORS → 5%**

**5-NERVE INJURIES**

**6-CONG. ANOMALIES → 3%**

# PERIPHERAL V. DISEASE

=In elderly people

D.M & vascular diseases are more common in this age group.

=Gangrene of a limb caused by arteriosclerosis

more difficult to treat in the presence of D.M because the tissues heal poorly and are more susceptible to infection in diabetic patients

# PERIPHERAL V. DISEASE

**=Diabetic Neuropathy.**

**Even when sub clinical, can cause delayed healing when diminished sensation results in repeated but unnoticed injuries**

# INJURY

**The 2nd most common indication for amput.**

**1= Crush injury: when the blood supply of a limb is irreparably destroyed or when the limb is so severely damaged that reasonable reconstruction is impossible**

**2= Thermal burns or frostbite**

**may destroy enough tissue to make  
amputation necessary**

**3= Severe electrical burns**

**often require amputation**

# INFECTION

**Infection, either acute or chronic, that is unresponsive to medical or other surgical measures may be an indication for amputation.**

# 1-fulminating gas gangrene

**Most dangerous and usually demands immediate amputation at a proximal level through normal viable tissues**

## 2-Chronic Osteomyelitis or an infected un-united fracture

1/19/2011

Professor Freih Abuhassan -  
University of Jordan

32

### **3- Carcinoma**

**develops in a chronic draining sinus**

**4- T.B lesions of the foot & ankle  
when secondarily infected.**

# TUMORS

**= Malignant tumors**

**(to remove the malignancy before it metastasizes )**

**= Amputation after metastases**

**(to relieve pain when a neoplasm has become ulcerated and infected or has caused a pathological fracture)**

Professor Freih Abuhassan -  
University of Jordan

36

# NERVE INJURIES

**=Trophic ulcers in an anesthetic limb.  
=Functionless limb.**

# CONGENITAL ANOMALIES

- 1- Fibular hemimelia & tibial hemimelia.**
- 2- PFFD.**

# Preop. Evaluation

## Tissue

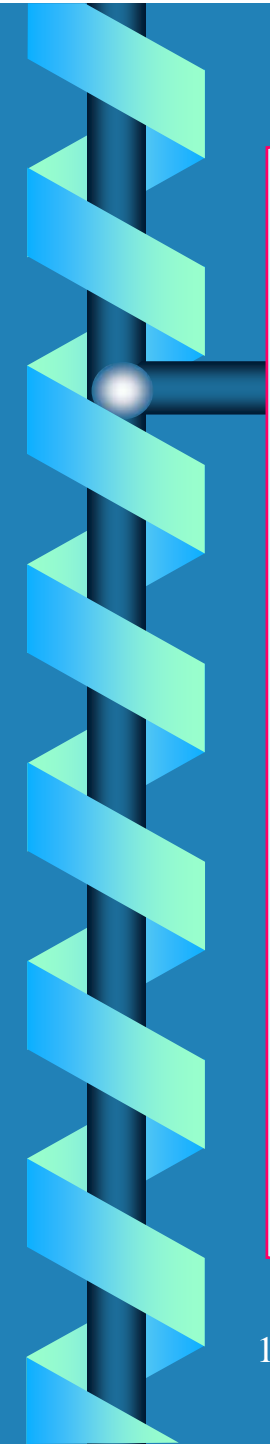

### 1. Clinical

Pulses, Skin temp., level of dependent rubor

### 2- Doppler

Ankle/ Brachial index

### 3-Toe systolic BP

**4-Transcutaneous PO<sub>2</sub>  
for assured healing**

**5-Arteriogram**

**6-Others:**

**Skin blood flow (Xe 133 clearance)**

**Thermography**

**Thallium scanning**

# Immune Competence

**Serum albumin at least 3g/dl**

**WCC more than 1500/ mL**

# Systemic

= Control D.M

= Evaluate

**Cardiac, Renal + Cerebral circ.**

= Preop TPN in malnourished pt

# Psychological

- = **Early plan for return to function**
- = **Preop Counselling**
- = **Amputee support groups**

# Preop Pain Control

## Pain Clinic review Spinal anaesthesia
